Profiting from Climate Change

In the past 10 years there has been a boom in coal, the most polluting of all fossil fuels. This trend was highlighted in December 2006 when E.ON applied to build the first new coal-fired power station in the UK in 30 years.

To counteract the dirty image of coal, coal companies such as E.ON are developing and promoting a number of processes to allow industry boosters to attach the adjective 'clean' before the word coal.

Some pollutants, such as sulfur dioxide, are removed before the waste products are released into the atmosphere. While this does lead to slightly lower levels of air pollution, the same amount of greenhouse gases are released.

Profiting from Climate Change

In the past 10 years there has been a boom in coal, the most polluting of all fossil fuels. This trend was highlighted in December 2006 when E.ON applied to build the first new coal-fired power station in the UK in 30 years.

To counteract the dirty image of coal, coal companies such as E.ON are developing and promoting a number of processes to allow industry boosters to attach the adjective 'clean' before the word coal.

Some pollutants, such as sulfur dioxide, are removed before the waste products are released into the atmosphere. While this does lead to slightly lower levels of air pollution, the same amount of greenhouse gases are released.

E.ON claim that their proposed new coal power station will be 'Carbon Capture Ready'. However the process of carbon capture has yet to be demonstrated to work on a commercial scale. Even if carbon capture should be proven to work at some point in the future, there is no legal requirement or deadline for adding the (very expensive) carbon capture technology.

Despite the hype from E.ON, coal is still the dirtiest power source, and 'clean coal' is little more than a distraction from the real solutions to climate change: reducing consumption, and increasing the amount of power generated from renewable sources.

While they try to brand themselves as a green energy company of the future, E.ON is looking more like an irresponsible fossil fuel dinosaur.

Today E.ON will undoubtedly be promoting their green credentials. However in the UK E.ON's portfolio accounts for just 2% of energy generated, with coal accounting for 61%. While investment in renewables is to be applauded, new power capacity from renewables should go along-side a reduction in fossil fuel use - not an increase!
